My name is Erik Sandqvist, and I have a strong passion for development. I have studied development with a specialization in web development at both the high school and university levels. What I am most passionate about is creating functional and appealing websites or tools that serve a clear purpose and provide value to others. I always strive for excellence and to challenge myself.

Experience

Intern, Keylinx (2025)

During my studies at the School of Engineering in Jönköping, I completed an internship at the IT consulting firm Keylinx. I worked as a developer, building a web-based application from scratch to manage internal processes, such as employee management. My responsibilities spanned the entire development lifecycle: from database design, modeling, and API development to testing, design, and frontend development. The technology stack I used included C#, .NET Core, and MudBlazor.

Warehouse Worker, IKEA Torsvik (2023 – Present)

I have been permanently employed at IKEA Torsvik since my final year of high school. I have successfully balanced this job with my studies and consistently work full-time during the summers. Over time, I have taken on additional responsibilities as a Coach/Buddy, which involves training new employees and acting as a go-to resource for my colleagues. Key takeaways from this role include a strong focus on quality and customer satisfaction, teamwork, and the ability to maintain a high and consistent pace of work.

Crew Member, McDonald's (2022 – 2023)

Selected Project

Station Allocation Automation, IKEA (2025 – 2026)

I identified an operational bottleneck at the warehouse where team leaders manually allocated workers to various stations using Excel every day. This manual process was time-consuming and often resulted in poor job rotation, with employees assigned to the same stations too frequently. Taking initiative, I designed and developed a full-stack web application from scratch to solve this. Utilizing a database and custom JavaScript logic, I fully automated the daily allocation process. I pitched and demonstrated the application to managers and team leaders, and it was highly appreciated for its ability to optimize administrative operations and ensure a fairer distribution of tasks.

Education

B.Sc. in Informatics: Web Development and Graphic Design (180 ECTS), School of Engineering, Jönköping University (2023 – 2026) A three-year degree program with a primary focus on full-stack and web development. The curriculum integrated software development and architecture with graphic design, alongside core courses in DevOps, cybersecurity, and marketing.

Physics 2 (6 ECTS), School of Engineering, Jönköping University (2026) university-level course taken to strengthen analytical problem-solving and technical engineering skills.

User-Centered Cybersecurity (10 ECTS), School of Engineering, Jönköping University (2025) Summer course in information security and user experience (UX), focusing on how to design secure systems.

Technology Program, Erik Dahlbergsgymnasiet, Jönköping (2020 – 2023) Upper secondary education specializing in web development. In addition to software and web programming, coursework included advanced mathematics (Mathematics 4) and German.
